

TOURATECH

Instructions for installing a Quest 12v/5v cord on a Touratech mount

For part numbers:

065-0089, 065-0090, 065-0091, 065-0092

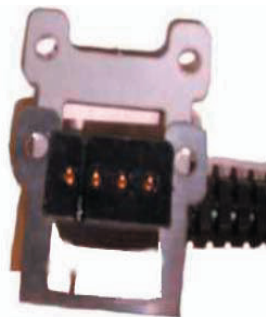

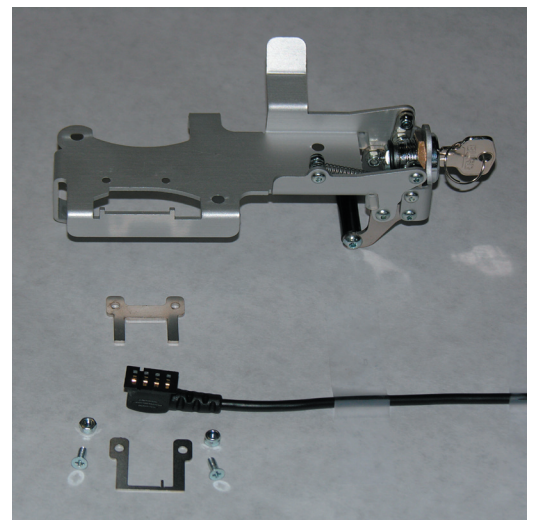

January 31, 2005

CAUTION – The Quest runs on 5 volts DC of power, use of any power cord not specifically designed for the Quest and without a 5-volt regulator will result in permanent, non-warranty damage to the unit.

Step 1 – Remove the power connector from the Quest vehicle suction mount that came with the unit. You will need to use a special screw bit due to the size of the screw to avoid stripping the head.

Step 2 – Remove the black plastic bracket that surrounds the connector. Note – this bracket has a very small “tooth” in it that sits in the groove in the connector between the contacts.

Step 3 – Disassemble the top part of the Touratech mount by unfastening the three bolts that connect top with bottom and are spaced by heavy black plastic spacers. The top part of the mount will now be separated from the bottom.

Step 4 – Slide on the thin bracket with the metal tooth over the connector so the tooth locks into the groove followed by the thicker bracket behind it. Align the holes and attach it to the mount using included bolts and nuts. (Hint: make sure the cord will exit to the right when attaching brackets to connector.)

Step 5 – Re-attach the top and bottom parts of the mount to complete installation. Check all bolts for tightness after having used the mount for approximately 300 miles.
